卷之三

MR. J. P. COOPER & CO.
FROM JACK HOBY

DATE: 22 March 1998

the Islands were surveyed with the monitoring instruments and live only to gamma. The permissible weekly dose at the present time in the laboratory at Los Alamos is 300 milliremeters (MR.) per week. With the present work week of 40 hours, the maximum dose rate for continuous exposure is about 5.5 MR. per hour.

卷之三

The entire graded area within the 1,000 foot radius from base was found to have an activity below IAR, per hour for the next part.

No indication of the position of the old toner base could be detected with the instruments. The metal scrap mentioned in Shlaer's report of 1 March 1950 has been removed to the lagoon side, well out of the working area.

卷之三

action 1/13/20

The grading operations on this Island have been completed. There was no activity on this Island greater than 1 MR. per hour.

On this Island the permanent camp for the Acorn area will be constructed. The activity on this Island was found to be zero.

The average activity on this island was 2 MR. per hour while some spots were found to be as high as 4 MR. per hour. There is no work planned for this Island. Even so, the "Hotest" spots there have a tolerance time of 75 hours per week.

We were below 100 feet, and max. I had was a band II activity of less than 1.00, per hour except for a scatter on the forward side of the nose like in a northeasterly direction, where the activity was as high as 1.5 sq. per hour.

The activity at the edges of the tower ~~is~~^{was} measured 5 ft. per hour with some of the footings as high as 12 ft. per hour. This corresponds to a minimum in the ~~period~~^{change of} of 10 hours of continuous, hours per week.

RE: GAMMA RAY ACTIVITY ON SHOT ISLANDS

DATE: 22 March 1950

-Page 2-

HONIT - (Cont'd)

The activity in a northwesterly direction, extending for about 100 feet from shore, is 2 MR. per hour.

It is directed that the rainmaker's use be continued during the grading operations on this island.

ZOGALLIA

No measurable activity was found on this island.

NOTES AND RECOMMENDATIONS

As of this date, 3/22/50, all islands of Enewetak atoll are declared free of radiation hazard, with the exception of the tower area on Runit. This area will be eliminated, as a radiation hazard, by the grading which should be completed within one month.

At present, film badges are being worn by all Holmes & Marver personnel on Enewetak atoll and some Army personnel on Enewetak Island, as well as the Navy personnel on Parry Island. A total of about 900 film badges are issued each month.

These film badges are designed to detect ionizing radiation, and from the above it is shown that no radiation hazard exists except on Ebariru and Runit. At present, the film badge industry is running at full peak in order to supply the demand for essential work. Probably between 30,000 and 50,000 additional badges will be required for future tests here. The production of this number of badges presents a serious problem of supply. It appears that we are not using good judgment in using so many film badges where no ionizing radiation hazard exists.

The processing of this large number of film badges ties up the entire film badge processing department at Los Alamos for several days each month.

Furthermore, the wearing of film badges presents an unfavorable psychological reaction in the workers, who assume a hazard must exist in the presence of these protective measures.

Re:

GAMMA RAY ACTIVITY ON SHOT ISLANDS

Date: 22 March 1950

-Page 3-

It is therefore recommended, subject to the approval of the Scientific Director of J.I.P.-3, that the wearing of film badges be discontinued immediately by all personnel except the workers on Runit, and that these be discontinued as soon as grading operations on this island are completed.
